## Discretization pages 1, 2, 3 Lecture Week 7

consider a PVCF 2nd order system

```
A = [0 1; -125 -20]
B = [0;1]
C = [1, 1]
D = 0
eig(A)
```

```
% the two eigenvalues of CT system are
T = 0.001 % 1 millisecond
Ad = expm(A*T) % remember to use expm() not exp()
Bd = inv(A)*(Ad-eye(2))*B
Cd = C
Dd = D
```

```
% using Matlab's built in function to find the discrete state
representation
sys_ct = ss(A, B, C, D) % create CT LTI object from matrices
sys_dt = c2d(sys_ct, T, 'zoh') % result is DT LTI object at sampling
time T
```

```
A =
```

```
    0    1
 -125  -20
```

```
B =
```

*Sample time: 0.001 seconds*

*Discrete-time state-space model.*

for completeness let us compute *Bd* by the integral definition

```
syms tal
```

```
Bds = eval(int(expm(A*tal), tal, 0, T)*sym(B)) % integrates to value
of T, eval implies numbers
```

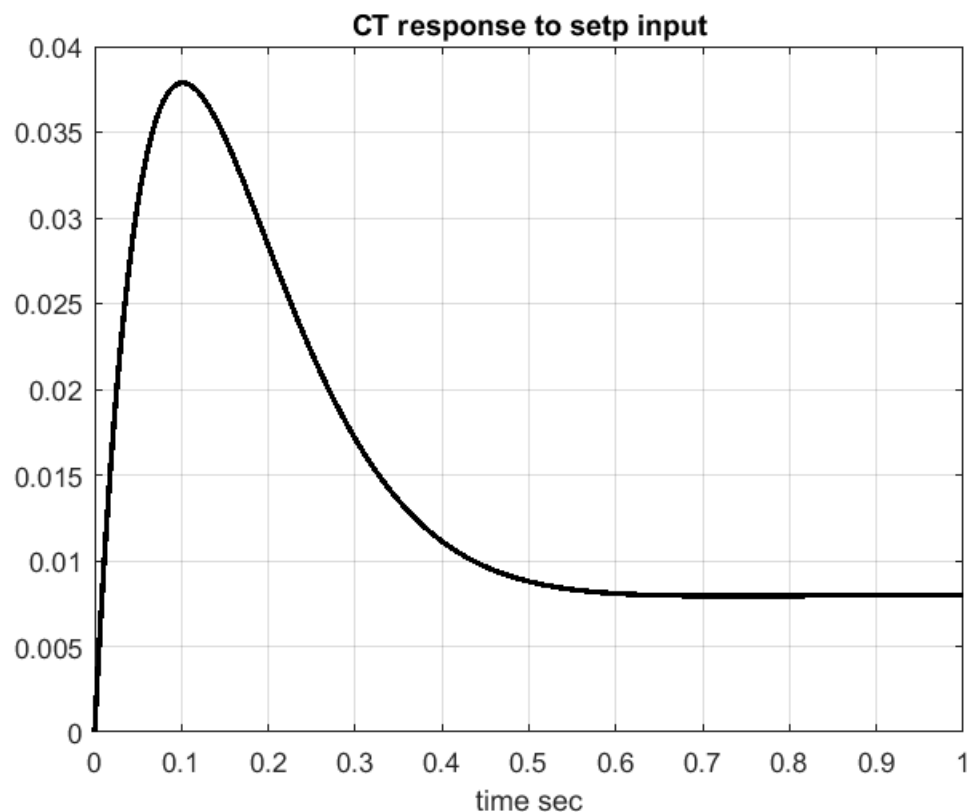

*Bds* =

```
1.0e-03 *
```

0.0005  
0.9900

## CT response using LTI object and step()

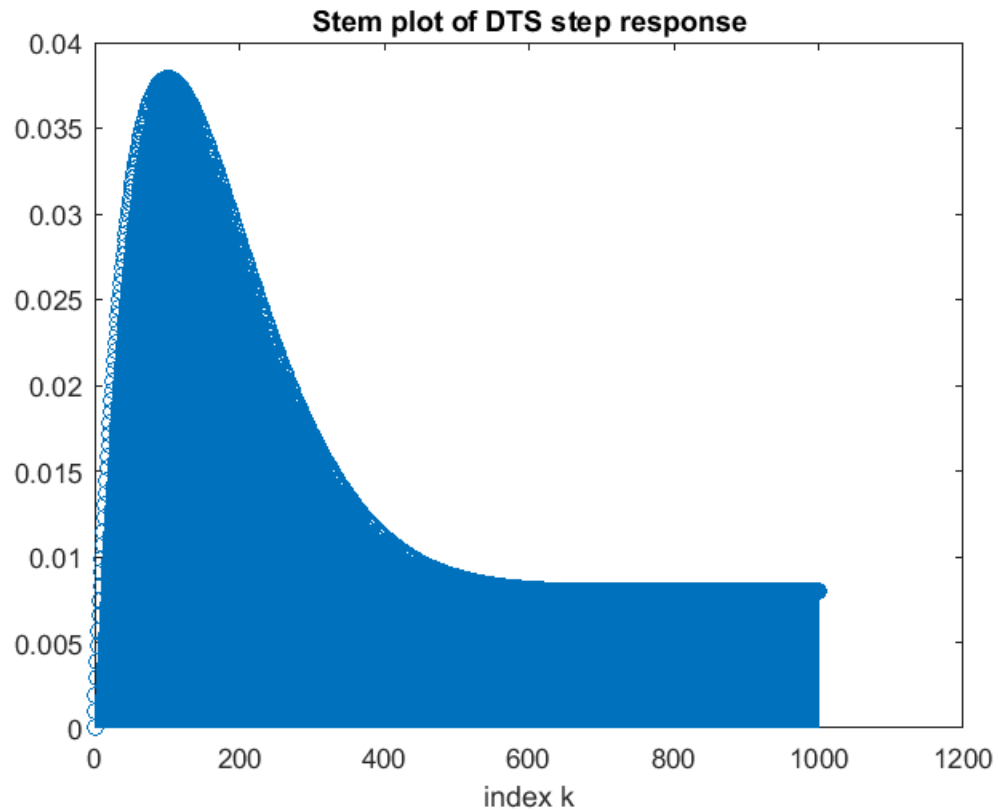

```
[Yc, Tc]=step(sys_ct, [0:T:1]); % plot CT step response form 0 to 1  
sec  
figure  
plot(Tc, Yc, 'k', 'linewidth', 2)  
grid on  
title('CT response to setp input')  
xlabel('time sec')
```

## recursively solve for the solution in the discrete domain

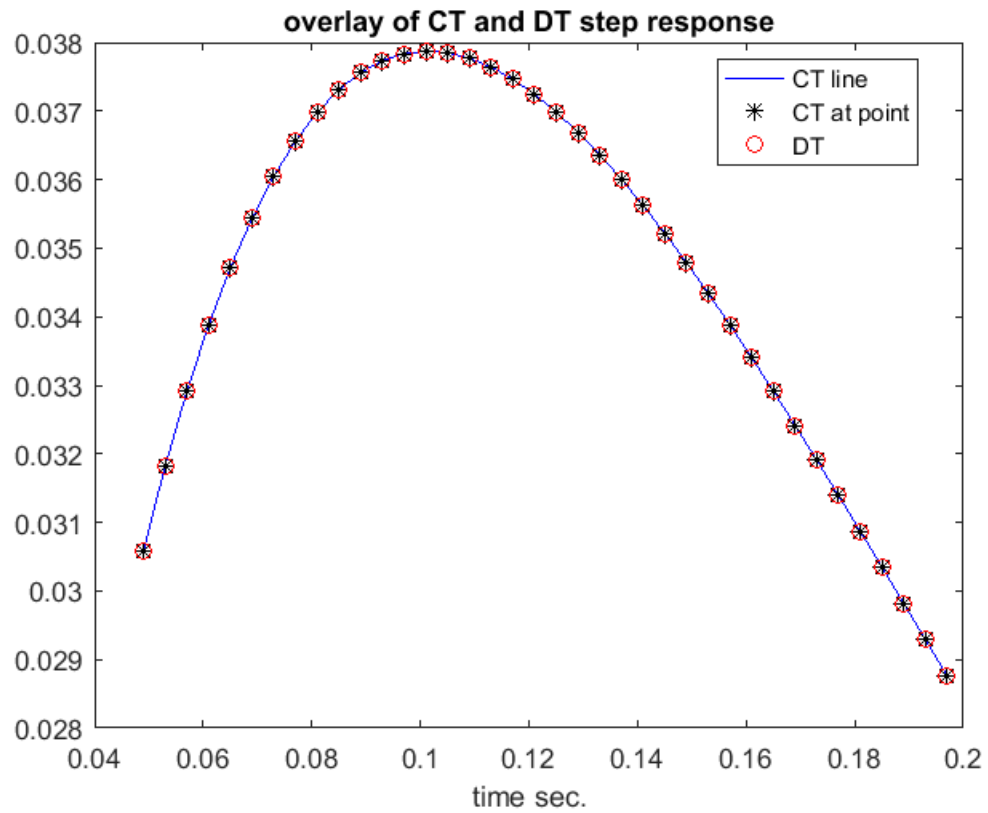

```
Td = zeros(size(Tc)); % set up array to hold time and outputs  
Yd = zeros(size(Yc));  
% IC = 0 since system is relaxed for step response by definition  
Xnew = [0;0]; % at k = 0 IC = [0;0]  
Yd(1) = Cd*Xnew;  
Td(1) = 0; % remember arrays in Matlab start at 1 these are k values  
not time
```

```
for k = 1: length(Tc);  
    Xold = Xnew;  
    Xnew = Ad*Xold+ Bd*1;  
    Yd(k+1) = Cd*Xnew;    % save output value  
    Td(k+1) = k;    % save corresponding discrete time integer index  
end  
figure  
stem(Td, Yd)  
title('Stem plot of DTS step response')  
xlabel('index k')
```

**compare CT and DT from 0.05 to 0.1 sec by overlaying**

```
figure  
rg = 50:4:200;    % spread out a bit for easier viewing  
plot(Tc(rg), Yc(rg), 'b', 'linewidth', .5)  
hold on  
plot(Tc(rg), Yc(rg), '*k')  
plot(T*Td(rg), Yd(rg), 'ro')  
legend('CT line', 'CT at point', 'DT', 'location', 'best')  
title('overlay of CT and DT step response')  
xlabel('time sec.')
```
